

MLDM- Tutorial Ensemble Learning

1. Which one is not the result of a high biased model?

- A. Under-fitting
- B. High error on train and test
- C. Over-fitting
- D. Un-interpretable model

2. Which one(s) is/are the result(s) of a high variance model?

- A. Low error on test and high error on train
- B. Low error on train and high error on test
- C. Low error on both train and test
- D. Under-fitting

3. The model is complex, there are a few data, then:

- A. Over-fitting happens
- B. Under-fitting happens

4. The model is weak, dataset is complex, then:

- A. Over-fitting happens
- B. Under-fitting happens

5. Several randomized samples, repeatedly training a single model means:

- A. Bagging
- B. Boosting
- C. Stacking

6. Boosting methods aim to reduce the bias.

- A. True
- B. False

7. Bagging methods aim to reduce the bias.

A. True

B. False

8. Which algorithm does iteratively take weighted samples from the dataset regarding the performance of the models to make weak learners strong?

A. Random Forrest

B. Neural Network

C. AdaBoost

D. Stacking

9. What is/are the difference(s) between Random Forests and Decision Trees?

10. What is/are the difference(s) between bagging and stacking methods?
